Aerial photographs (A15728-122, A15728-80, A15728-63) taken in 1967 by the Canadian National Air Photo Library showing the various moraines (Harris Creek, K-V-1), ice, and proto-moraines being formed as a result of surges of the Klutlan Glacier and its tributaries (see Wright (1980) and Driscoll (1980) Quaternary Research 14 for details).
